Reconsidering Wilkinson’s Income Inequality Hypothesis: New Evidence from Argentina.

Wilkinson’s income inequality hypothesis asserts that our health is influenced not just by our own income (following ideas of the social gradient in health), but also be how income is distributed in the place in which we live. The hypothesis forms an integral part of the social determinants of health literature. However, a consensus on its validity has not been reached, and much remains contested on methodological and theoretical grounds. This presentation outlines new analyses of the income inequality hypothesis in Argentina.

When: November 2, 2011
Time: 2:30 PM
Where: Batelle, Basement
